Grape mealybug (*Pseudococcus maritimus*) sampling

We found 1st and 2nd instar GMB nymphs in Rutherford and Oakville. These are nymphs of the summer generation of GMB.

The nymphs were found (1) in clusters that were in contact with woody parts of the vine, (2) under the bark where the clusters were resting, and (3) on spurs.

Variety (Location)	No. vines inspected (No. with GMB)	1st instar	2nd instar	Location on vine
CS (Rutherford)	6 (3)	14	73	Cluster & bark under cluster
CS (Oakville)	3 (2)	6	0	Spur
